

Viz report # 1:

While looking for graphs from CNN, I found an article from October 7, 2022 regarding a study about breast cancer and how mortality has dropped by 43% but racial disparities still remain. The graphic above shows 5 races and their respective rates. What I like about this graphic is that it clearly states that though Black women die at a higher rate from breast cancer, White women have a higher rate of being identified as having breast cancer. This observation thus effectively highlights that there disparities regarding race still remain and thus the medical community's attitude regarding race should be evaluated and if possible, reformed.
